

# Photodynamic Therapy (PDT)

“Beautiful healthier skin” “easy and safe”

You can dramatically improve your skin’s condition and appearance.....

We are all born with beautiful skin but many of us allow it to be badly damaged by sun exposure or poor diet or cigarette smoking. Sun damaged skin can lead to dangerous skin cancers all of which make us look much older than our actual age.

Photodynamic Therapy (PDT) has been in use for many years and is considered one of the major advances in cosmetic medicine over the past 50 years.

PDT involves putting a special solution on the face or hands and then having an IPL light treatment to activate the solution. The light energy safely and gently results in bad skin being replaced by the human body, with fresh new skin being produced a short time after the treatment.

You can now have this excellent treatment at Medici Clinic (Berwick Specialist Medical Centre) – 50 Kangan Drive, Berwick performed by experienced trained health professionals.

The treatment is extremely safe, inexpensive and can be applied to most parts of the body where sun damage has taken place.

Imagine removing all ugly sun spots, freckles and ageing marks safely and simply. Photodynamic therapy is also effective for open pores, oily skin, poor skin tone, fine lines, red facial areas (Rosacea), warts, and acne sufferers can also be helped with one or more treatments.

Photodynamic Therapy is routinely used by Doctors, not only to achieve cosmetic improvement, but also as an annual preventative measure against further sun damage to your skin.

The best news for women is that Photodynamic Therapy can be very effective for those areas that cause us the most concern – the décolletage (from neck to breast bone areas). The treatment is safe gentle and improves general skin tone as well as banishing those ugly brown blotches and freckles!
